XIAOMENG LI

Seattle, WA | 425-340-5418 | li.xiaomen@northeastern.edu | LinkedIn

SUMMARY

AI-native software engineer with production experience building agentic systems, MCP integrations, and LLM-powered features at an AI testing startup serving 100K+ developers. Strong prompt-engineering depth across Claude Code, OpenAI Codex, and browser-use. Full-stack background in React, Node.js, and serverless AWS.

EDUCATION

Northeastern University — M.S. in Computer Science, Align Program Sep 2024 – May 2027 (Expected)

GPA: 3.7 / 4.0 *Seattle, WA*

Relevant Coursework: Algorithms, Object-Oriented Design, Discrete Structures, Web Development, Natural Language Processing, Intensive Foundations of Computer Science

TECHNICAL SKILLS

Languages:	Python, TypeScript, JavaScript, Java, SQL
AI & Agentic Systems:	LLM Integration, Prompt Engineering, Multimodal LLMs, MCP, Claude Code, OpenAI Codex, browser-use
Frontend:	React, Next.js, Tailwind CSS, MUI
Backend:	Node.js, REST APIs, GraphQL, Serverless Architecture
Cloud & Tools:	AWS (Lambda, S3, Amplify), Docker, GitHub Actions, Jira

EXPERIENCE

TestSprite, Inc. — Software Engineering Intern Jan 2026 – Present

AI-native autonomous end-to-end software testing platform (100K+ users) *Seattle, WA*

- Shipped a full-stack **product analytics dashboard** with serverless **AWS Lambda** pipelines for real-time cohort aggregation, and authored an internal **Claude Code skill** that analyzes monthly churn cohorts—replaying each canceled user's pre-cancellation behavior trace, hypothesizing root causes, and auto-generating prioritized product TODOs that feed directly into the engineering backlog.
- Enhanced the core **AI-powered testing engine** exposed via **MCP** through systematic **prompt engineering**, materially improving test reliability and report quality across IDE integrations (Claude Code, OpenAI Codex, etc.).
- Redesigned the **AI-generated test report pipeline** with richer visualizations and clearer failure attribution; new format adopted as the engineering team's default output.
- Designed and shipped **multi-user collaboration features**—cross-account test visibility and real-time workspace state sharing—reducing friction in team QA workflows and increasing platform stickiness.
- Built **test lifecycle and organization features** (deletion, batch operations, suite management) shipped to production and actively used by **20,000+ developers** managing large test suites at scale.

Danspace Cultural Media Co., Ltd. — Software Engineering Intern (Full Stack) Mar 2024 – Jun 2024

Beijing, China

- Developed interactive **WeChat mini-game** features in Java with backend game logic, improving user engagement and session retention.
- Built a Python-based **customer analytics dashboard** with cloud deployment, enabling real-time visualization of engagement metrics for business stakeholders.
- Delivered responsive production UI components (HTML, Tailwind CSS, JavaScript); contributed to a **Universal Studios Beijing** partnership prototype.

PROJECTS

AI Personal Shopping Agent · *Python, browser-use, Multimodal LLMs, Prompt Engineering* 2026

- Built a multi-site shopping agent on top of a **forked and modified browser-use** framework, autonomously crawling retailers (Zara, UNIQLO, REI, Nordstrom, multi-brand boutiques, etc.) where dynamic JS, anti-scrape, and auth walls block clean API access—tracking new arrivals, sale drops, and price changes.
- Engineered the agent to **deep-crawl product detail pages** for size-level availability and physical-store inventory—solving a real friction point where shoppers must click into dozens of pages just to find their size in stock—with robust retry and partial-state recovery for long-running browser sessions.
- Built a **vision-language matching pipeline** that learns a user's aesthetic from a small set of reference outfit images and filters inventory by color, silhouette, and style—routing cheap vision models for retrieval and a stronger model for final composition to keep per-recommendation cost low; outputs an interactive **shoppable lookbook** with each item cross-linked to a live, size-verified product page.

AI-Driven Survival Horror Game · *OpenAI Codex, Prompt Engineering, Game Design* 2026

- Designed and shipped a **Resident Evil**-inspired survival horror game by orchestrating **OpenAI Codex** end-to-end—architecting mechanics, asset pipelines, and gameplay loops through structured prompt engineering.
- Demonstrated practical **"coding-agent driver"** capability: translating creative design intent into prompts that produce shippable, maintainable code.
