XIAOMENG LI

Seattle, WA | 425-340-5418 | li.xiaomen@northeastern.edu | LinkedIn | GitHub

SUMMARY

Software engineer with production experience building AI-powered developer tools and agentic systems on an AI testing platform with 100K+ registered developers. Full-stack across Python, TypeScript, React, and serverless AWS, with experience in LLM applications, LLM evaluation, and applied ML.

EDUCATION

Northeastern University — M.S. in Computer Science, Align Program *Sep 2024 – Dec 2027 (Expected)*

GPA: 3.78 / 4.0 · Coursework: Algorithms, Data Structures, OOD, Web Development, Machine Learning, Cloud Computing *Seattle, WA*

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, Java, SQL
AI/ML: LLM Integration, Multimodal LLMs, MCP, Agentic Workflows, Prompt Evaluation, PyTorch, Transformers
Backend & Cloud: Node.js, REST APIs, GraphQL, AWS (Lambda, DynamoDB, S3, Cognito, Amplify), MySQL, Serverless Architecture
Frontend: React, Next.js, Tailwind CSS, Material UI
Tools: Docker, GitHub Actions, Git, Jira

EXPERIENCE

TestSprite, Inc. — Software Engineering Intern *Jan 2026 – Aug 2026*

AI-native autonomous end-to-end testing platform with 100K+ registered developers *Seattle, WA*

Product Analytics Dashboard *React · TypeScript · AWS Lambda · LLM*

- Built and owned an internal analytics dashboard end-to-end, replacing manual database queries with real-time tracking of sign-ups, feature adoption, and retention across international markets; developed the AWS Lambda data layer, React frontend, and LLM-powered insight generation.
- Adopted as the CEO's daily reporting tool and the marketing team's primary source for user behavior analysis, surfacing cancellation patterns and regional sign-up trends that informed KOL selection and campaign timing.

Project Deletion APIs *DynamoDB · AWS Cognito · Automated Testing*

- Built production deletion APIs for tests, suites, reports, and run history; implemented Cognito-based authorization, dry-run previews with affected-resource counts, and soft-delete recovery.
- Added automated tests for cascading DynamoDB cleanup across related resources using partition/sort-key relationships.

Churn Analysis Agent *Claude Code · LLM Agents*

- Built an agentic churn-analysis workflow in Claude Code that replays each canceled user's pre-cancellation behavior trace, correlates product interactions with cancellation timing, and generates prioritized root-cause hypotheses and engineering TODOs for product investigation.

AI Testing Engine & Reporting *MCP · Tool Use · Prompt Evaluation*

- Improved the MCP-exposed AI testing engine through iterative prompt and tool-use evaluation, refining test-generation workflows and failure attribution across Claude Code, Cursor, and VS Code integrations; redesigned the report pipeline with richer visualizations and structured failure context, adopted as the engineering team's default format.

Danspace Cultural Media Co., Ltd. — Software Engineering Intern (Full Stack) *Beijing, China · Mar 2024 – Jun 2024*

- Developed Java-based WeChat mini-game features and a Python analytics dashboard with cloud deployment; delivered responsive production UI components and contributed to a Universal Studios Beijing partnership prototype.

PROJECTS

AI Personal Shopping Agent *Python · browser-use · Multimodal LLMs*

- Built a multi-site shopping agent on a forked browser-use framework that navigates dynamic JS, anti-scraping, and authentication barriers; deep-crawls product pages for size-level and in-store availability with retry and partial-state recovery for long-running browser sessions.
- Built a vision-language pipeline that learns a user's style from reference outfit images, routing cheap vision models for retrieval and a stronger model for final ranking to keep per-recommendation cost low.

AI Video Template Engine | GitHub *Python · LLMs · FFmpeg*

- Built a Python/LLM pipeline that analyzes short-form videos for hooks, transitions, text effects, and editing structure, converting videos into reusable JSON templates that separate editing logic from source assets.
- Implemented FFmpeg-based asset substitution and programmatic reconstruction, enabling the same editing structure to be applied to new source footage.

Streaming Code-Switching Prediction (CS6140 Team Project, In Progress) *Python · PyTorch · Transformers*

- Developing a causal multitask model that, from only a streaming text prefix, predicts whether the next token switches language and how long the switched segment will last, using the SwitchLingua dataset.
- Benchmarking LLM baselines on Chinese–English and Japanese–English subsets by switch-prediction F1, owning the Claude baseline runs.
